## **Port Scanner**

**SE 305 : Software Project Lab-1**

**Submitted by**

**MD Akram Khan**

**BSSE Roll No. : 1007**

**BSSE Session: 2017-2018**

**Supervised by**

**Dr. B M Mainul Hossain**

**Designation: Associate professor**

**Institute of Information Technology**

**Institute of Information Technology,**

**University of Dhaka**

**29-05-2019**

**Table of Contents:**

1.Introduction .....1

1.1. Background Study.....1-3

1.2. Challenges.....3

2. Project Overview .....4-7

3. User Manual .....8-9

4. Conclusion ..... 10

5. Appendix.....10

6. References.....10-11

# 1.Introduction

A port scan is a method for determining which ports on a network are open. As ports on a computer are the place where information is sent and received, port scanning is analogous to knocking on doors to see if someone is home.

Port scanning is accomplished by sending a message to each port, one at a time. The kind of response received indicate whether the port is used and can be probed for further weakness. Port scanners are important to network security technicians because they can reveal possible security vulnerabilities on the targeted system.

## 1.1 Background study

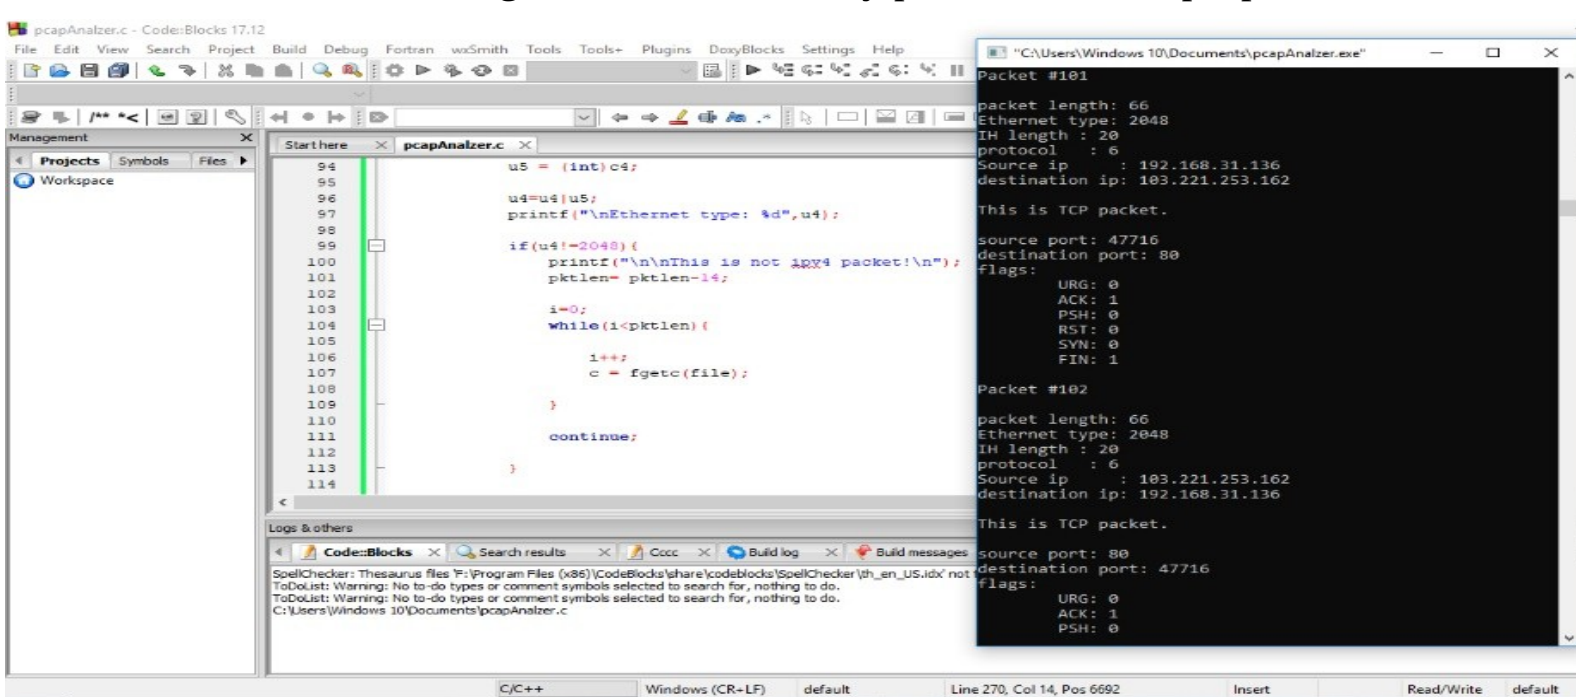

**Networking Basics** : To make a port scanner , I needed to learn the networking basic topics like OSI layer, protocol etc and keywords like port, firewall, lan etc .

Source : <https://www.digitalocean.com/community/tutorials/an-introduction-to-networking-terminology-interfaces-and-protocols>

**PCAP File Analyzer** : I needed to learn the packet parsing. I have also studied about the TCP, IP header and written a code for packet

parsing from a pcap file so that I can find out the source IP address, destination IP address, source and destination port no, sequence number, acknowledgement number of any packet from this pcap file.

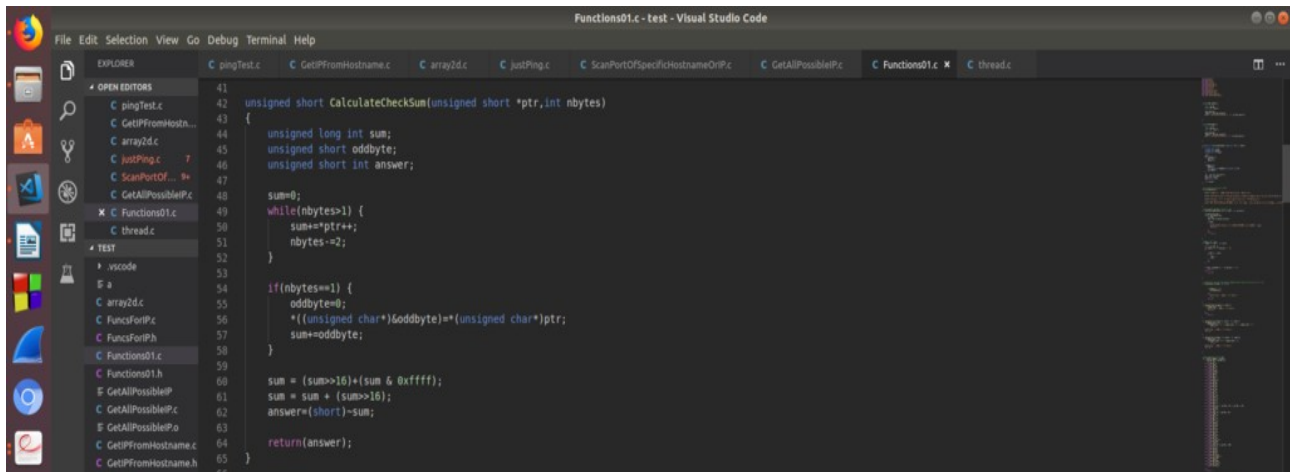

**Raw Socket** : A raw socket is a type of socket that allows access to the underlying transport provider. I have learned raw socket to send tcp packet to specific host to scan port of this host.

**Checksum Calculation** : A checksum is an error-detection method. To test data integrity, the sender of the data calculates checksum value by taking the sum of the binary data transmitted. When receiving the data,

the receiver can perform the same calculation on the data and compare it with the checksum value provided by the sender. If the two values match, the receiver has a high degree of confidence that the data was received correctly.

## 1.2. Challenges

Implementing a new software solution carries with it a number of challenges. The process can be overwhelming, confusing and lengthy. For implementing this project there are lot of challenges that I have faced. Some of them are :

- 1) Using multiple file for c source code , which was difficult for me.
- 2) Sending packet using raw socket properly.
- 3) Receiving the reply packet from any host correctly.
- 4) Understanding the state of any port of specific host.
- 5) Using timer for filtered port of any host.
- 6) Facing problem for not understanding the term endianness .

## 2. Project Overview

TCP SYN scan is used in this port scanner to scan the ports.

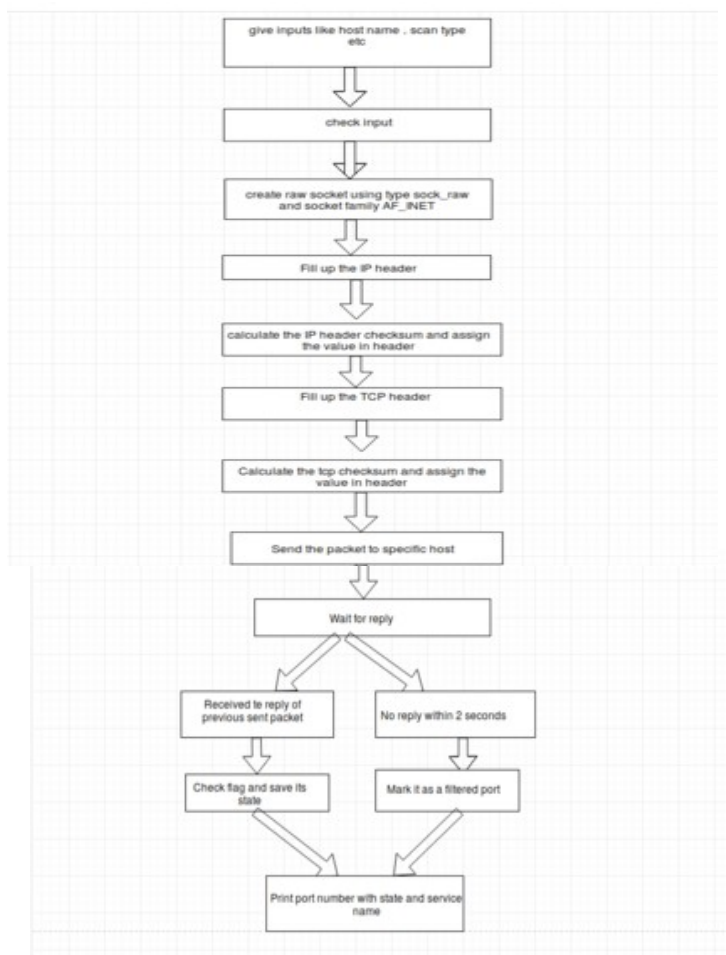

image source : <https://medium.com/@avirj/nmap-tcp-syn-scan-50106f818bf1>

At first, inputs given by the user will be checked whether it is correct or not .

```

139
140 int isGivenThreeCorrectInput(char argv2[]){
141     if(!isEqual(argv2, "-P")){
142         printf("Type \\. /akMap -h \\for Help\\n");
143         return 0;
144     }
145     else
146         return 1;
147 }
148
149
150 int isGivenFourCorrectInput(char argv2[], char argv3[]){
151     if(isEqual(argv2, "-S"))
152         if(isEqual(argv3, "-A") || isEqual(argv3, "-O") || isEqual(argv3, "-F"))
153             return 1;
154     printf("Type \\. /akMap -h \\for Help\\n");
155     return 0;
156 }
157
158

```

Using this Port Scanner , can detect the state of specific port of any live host . Raw socket is used to send and receive the TCP packet.

```

94
95 SOCK = socket (AF_INET, SOCK_RAW, IPPROTO_TCP);
96
97 if(SOCK == -1)
98 {
99     perror("FAILED to create SOCKET!");
100     exit(1);
101 }
102
103

```

Then the IP header is filled up properly as we have used raw used. Here checksum is calculated after the filling up all the value so that the checksum remains correct.

```

118
119 iph->ihl = 5;
120 iph->version = 4;
121 iph->tos = 0;
122 iph->tot_len = sizeof (struct iphdr) + sizeof (struct tcphdr) + strlen(data);
123 iph->id = htonl (54321);
124 iph->frag_off = 0;
125 iph->ttl = 255;
126 iph->protocol = IPPROTO_TCP;
127 iph->check = 0;
128 iph->saddr = inet_addr ( source_ip );
129 iph->daddr = sin.sin_addr.s_addr;
130
131
132 iph->check = (CalculateChecksum((unsigned short *) datagram, iph->tot_len));
133
134

```

Then the TCP header is filled up properly. Here checksum is calculated after the filling up all the value and filling up the pseudo header so that the checksum remains correct.

```

tcph->source = htons (15111);
tcph->dest = htons (portNo);
tcph->seq = 110;
tcph->ack_seq = 110;
tcph->doff = 5;
tcph->fin=0;
tcph->syn=1;
tcph->rst=0;
tcph->psh=0;
tcph->ack=0;
tcph->urg=0;
tcph->window = htons (5840);
tcph->check = 0;
tcph->urg_ptr = 0;

psh.source_address = inet_addr( source_ip );
psh.dest_address = sin.sin_addr.s_addr;
psh.placeholder = 0;
psh.protocol = IPPROTO_TCP;
psh.tcp_length = htons(sizeof(struct tcphdr) + strlen(data));

psize = sizeof(struct pseudo_header) + sizeof(struct tcphdr) + strlen(data);
pseudogram = malloc(psize);

memcpy(pseudogram, (char*) &psh, sizeof (struct pseudo_header));
memcpy(pseudogram + sizeof(struct pseudo_header), tcph, sizeof(struct tcphdr) + strlen(data));

tcph->check = CalculateChecksum( (unsigned short*) pseudogram, psize);

```

Instead of computing the checksum over only the actual data fields of the TCP segment, a 12-byte TCP *pseudo header* is created prior to checksum calculation. It contains the most important parts of the IP header, that is, source and destination address, protocol number and data length.

```

27
28 struct pseudo_header
29 {
30     unsigned int source_address;
31     unsigned int dest_address;
32     unsigned char placeholder;
33     unsigned char protocol;
34     unsigned short int tcp_length;
35 };
36

```

Checksum is used to ensure the integrity of a file after it has been transmitted from one storage device to another. This can be across the Internet or simply between two computers on the same network.

```

unsigned short CalculateChecksum(unsigned short *ptr,int nbytes)
{
    unsigned long int sum;
    unsigned short oddbyte;
    unsigned short int answer;

    sum=0;
    while(nbytes>1) {
        sum+=*ptr++;
        nbytes-=2;
    }

    if(nbytes==1) {
        oddbyte=0;
        *((unsigned char*)&oddbyte)=*(unsigned char*)ptr;
        sum+=oddbyte;
    }

    sum = (sum>>16)+(sum & 0xffff);
    sum = sum + (sum>>16);
    answer=(short)-sum;

    return(answer);
}

```

Now, the packet needs to be sent to the specific port of specific host.

```

if (sendto (SOCK, datagram, iph->tot_len , 0, (struct sockaddr *) &sin, sizeof (sin)) < 0)
{
    perror("sendto failed");
    exit(0);
}

```

If the host machine is live and it doesn't have any firewall, then it will receive the packet and , it will reply with another packet . From the reply, the poer state can be understood. If in the reply packet both RST and ACK flag value is 1, then this port can be said to be closed. Again if in the reply packet the ACK and SYN flag value is 1 , then the port can be claimed as open. If there is no reply within 2 minutes , then the port will be considered as filtered.

```

217         portState[counter] = "open";
218         openNfilteredPort[counter] = portNo;
219         counter++;
220         break;
221     }
222 }
223
224
225     else if(tcp->rst && tcp->ack){
226         closedPortCounter++;
227         break;
228     }
229 }
230 }
231
232 }
233
234 }
235
236 if(flag){
237     portState[counter]="filtered";
238     openNfilteredPort[counter] = portNo;
239     counter++;
240 }

```

```

ak-47@ak47:~/Desktop/test$ sudo ./a yahoo.com -S -O 23

Starting PortScanner at : Tue May 28 17:18:31 2019
Scan report for 98.137.246.7

PORT    STATE    SERVICE
23      filtered TELNET

Closing PortScanner at : Tue May 28 17:18:43 2019
ak-47@ak47:~/Desktop/test$

```

### 3. User manual

First go to the ubuntu terminal and Browse to the folder where the executable file is stored. Then, type the command “ **sudo ./executable fileName -h** ” to see the user manual.

```

ak-47@ak47:~/Desktop/test$ sudo ./a
Usage:
  : ./akMap {Target Specification} [Option]

Target Specification:
  Can pass Hostname or IP address
  Example: www.iit.du.ac.bd, 192.254.188.83

Techniques:
  -S : TCP SYN Scan

PORT SPECIFICATION and SCAN ORDER :
  -p <Port ranges> : Only scan Specific Ports
    Example : -p 10-120

  -O <Port number> : Only One specific Port
    Example : -O 80

  -F : Fast Scan fewer ports than the Default Scan
  -D : Default port Scan From (1-50000)

ak-47@ak47:~/Desktop/test$

```

1) Only one random port of specific host can be scanned using the following command:

“**sudo ./executableFileName hostName -S -O portNo**”

```

ak-47@ak47:~/Desktop/test$ sudo ./a yahoo.com -S -O 23

Starting PortScanner at : Tue May 28 17:18:31 2019
Scan report for 98.137.246.7

  PORT    STATE    SERVICE
   23     filtered TELNET

Closing PortScanner at : Tue May 28 17:18:43 2019
ak-47@ak47:~/Desktop/test$

```

2) More than one port can also be scanned using this port scanner using the following command :

**“sudo ./executableFileName hostName -S -p startingPortNo -endingPortNo ”**

```

ak-47@ak47:~/Desktop/test$ sudo ./a bbc.com -S -p 75-80
Starting PortScanner at : Tue May 28 14:34:44 2019
Scan report for 151.101.64.81

PORT      STATE      SERVICE
75        filtered
76        filtered
77        filtered
78        filtered
79        filtered
80        open      HTTP

Closing PortScanner at : Tue May 28 14:34:57 2019
ak-47@ak47:~/Desktop/test$

```

3) Some common ports of specific host can be scanned using this scanner by the following command :

**“sudo ./executableFileName hostName -S -F”**

```

ak-47@ak47:~/Desktop/test$ sudo ./a fusionbd.com -S -F
Starting PortScanner at : Tue May 28 14:35:42 2019
Scan report for 192.254.188.83

15 Ports are closed.

PORT      STATE      SERVICE
21        open      FTP
22        filtered  SSH
23        filtered  TELNET
25        filtered  SMTP
53        open      DNS
80        open      HTTP
110       open      POP3
137       filtered  NetBIOS
138       filtered  NetBIOS
139       filtered  NetBIOS
143       open      IMAP
443       open      HTTPS
465       open      SMTPs
587       openSubmission
993       open      IMAPS
995       open      POP3S
2222      openEtherNetIP-1
3306      open      MySQL
8888      openHTTP-Proxy
8443      open      HTTPS-alt

Closing PortScanner at : Tue May 28 14:36:08 2019
ak-47@ak47:~/Desktop/test$

```

4) Default scan is used to scan ports from 1-50000 sequentially using the following command :

**“sudo ./executableFileName hostName -S -D”**

## 4. Conclusion

This project helps me to understand computer networking and improve my coding skill and I have learned to handle multiple source file in c for the first time. I hope it will help me to deal with difficulties in future. This project was quiet challenging as I didn't have any knowledge about computer networking before doing this project and I gained a lot of experience from it. Hope this knowledge will help me in my future networking related projects. I want to thank my supervisor for guiding me a lot during this project.

## 5. Appendix

In this project, I have made a port scanner . I have also tried to send icmp packet to any host to check whether it is live or not, but, I am facing so many difficulties in doing this. In future, I have plan to complete this task, so that I can scan all the host in my LAN to check , which machines are live . I will also be able to ping any valid host to see whether the server machine is live or not.
